**Git test: edit  run/preview  save  commit  push  open remote. Record the test commit and result.**

Commit works good

**Instructor access and team Git readiness: what did you test? Solo: say solo.**

Team

**1  Introduction  scan notes, one useful idea and one question**

We observed why mindset is important, my question I have is How to develop a growth mindset when doing game development? We also noticed that when you do game development you have to have a good mindset.

**2  Developer mindset  scan notes, one useful idea and one question**

We observed collaboration during game development, Why is a growth mindset important? We also seen that you have to been open to recieve feedback, celebrating small wins after acheiving the mission.

**3  Folders and project creation  scan notes, one useful idea and one question**

Professor Stalbert shows us how to create the folders, how we log everything, the reason why we have folders because it's good to be organized so your not having a mess of files everywhere and get lost. Why is it important to make a folder

**4  Documentation  scan notes, one useful idea and one question**

I learned that documentation is an important part of game development because it helps keep track of the game's progress, ideas, and development process. Keeping organized notes and documenting changes can make it easier to work on the game, remember important details, and communicate with other team members. What information should we include in our game development documentation to make sure our project stays organized? I used ChatGPT to get my answer.

**5  Introduction to Unity  scan notes, one useful idea and one question**

I learned that following the game development process step by step helps keep the project organized and makes it easier to understand what needs to be completed. Taking notes and keeping track of progress helps prevent mistakes and makes it easier to continue working on the game later. How can we use what we learned in this video to improve our own game project? I used ChatGPT to get my answers.

**6  Import a custom player  scan notes, one useful idea and one question**

I successfully imported the custom player 3D model and rigged skeleton into the game engine pipeline. The mesh, textures, and animations mapped correctly without breaking the default bone hierarchy. I created a reusable asset import preset inside the engine. This automatically configures rigging settings, materials, and scale factors for any future custom characters added to the project. How do we optimize the texture resolution and polygon count of this custom player model to maintain a stable frame rate when multiple characters are on screen at once? I used Google

## CS110 / INDEPENDENCE ROAD

Gemini to answer the question.

**Your interpretation: what can this pipeline contribute to a prior or new story?**

I implemented the core tracking mechanic for the bounty contracts, linking target NPCs to a dynamic UI board. I decided to use a vector-based distance check to update a compass indicator, showing the player the relative direction of their bounty target. The target spawning system accurately reads the contract data, instantiates the unique boss model at a designated waypoint, and triggers the "Wanted: Alive or Dead" UI prompt when the player enters the zone. What is the most efficient way to manage target pathfinding across large maps so they can actively flee or ambush the player without causing performance drops? I use Google Gemini to answer the question.

**Questions to resolve before committing to a team or mission**

What are the expectations for this team?

What goals will this team do?

### Whiteboard

I put the notes in order on what we did for our Bounty App. I used Google Gemini to get the answers
